ABSTRACT

A process is disclosed for recycling carbon dioxide emissions from a fossilfuel power plant into useful carbonated species. The process primarily
comprises the steps of: a) burning the fossil fuel, thereby generating heat
and a hot exhaust gas containing CO₂; and b) converting the heat into
energy. The process is characterized in that it further comprises the steps
of: c) cooling the exhaust gas; and d) biologically transforming the CO₂
contained in the cooled exhaust gas into carbonated species, thereby
obtaining a low CO₂ exhaust gas and producing useful carbonated species.
The low CO₂ exhaust gas obtained in step d) can be released in the
atmosphere without increasing the problem of greenhouse effect.
